HAXO-8 air filter

May 3rd, 2010

The HAXO-8 air filter is made from 316 stainless steel fine mesh with a 10 micron pore size. This filter provides excellent consistency and the ability to block liquid water. Being 316 stainless, it does not absorb moisture and is chemically resistant.

The filter is a 0.15mm thick mesh disk and is retained in the case with a specially moulded retaining ring which sits under the front label and sandwiches between the filter disk and the top label.

The retaining ring incorporates a cut-out section on the edge to allow prying of the ring out with a sharp knife to allow filter replacement if required.
